

INVICTUS EARTH2 KEEPERS

WeAreDevelopers x BAND · AI Dark Factory
Track: tablekeeper

A dark factory where nothing ships until three different
seats turn their key.

By: Team Earth2

Built on open models only: OpenCode seats on GLM-5.2 via Featherless, coordinated in BAND.

A single agent cannot be trusted to check its own work.

1 Plan

Planner turns the spec into numbered requirements and owns every decision. Its mandate forbids writing product code.

2 Build

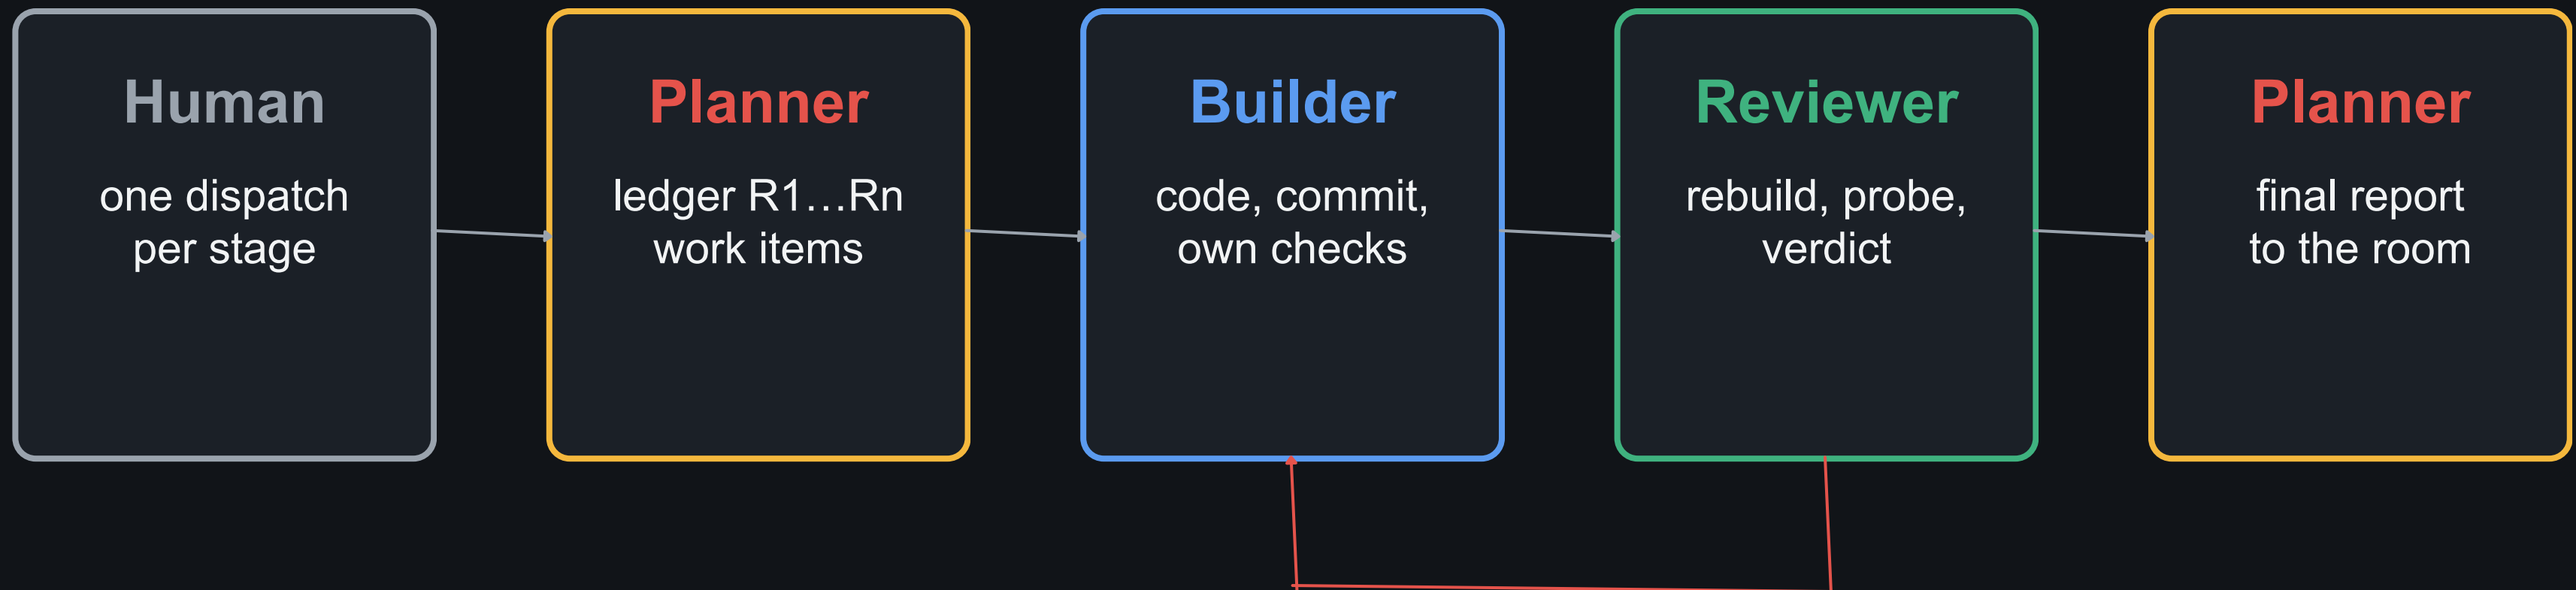

Builder implements one scoped work item, verifies it, commits it, and hands off the commit id.

3 Verify

Reviewer rebuilds from scratch and tests beyond the shipped checks. Its mandate forbids editing the code it judges.

A stage is done only when all three keys have turned: a ledger, a commit, and an independent ACCEPT with evidence.

One human message in. A verified service out.

REJECT: numbered failures with a reproduce command → fix → new commit → re-review

Every handoff carries the full requirement text, because a seat only sees messages that @mention it.

Three seats, each with one job and one thing it may never do.

Seat	Owns	Mandate forbids	Hands off
Planner	Requirements ledger, work items, decisions, final report	Writes product code; asks the human	Full requirement text + paths to Builder and Reviewer
Builder	Implementation, its own checks, commits	Claims a pass it did not run; rewrites history	Commit id, requirements covered, run/check commands
Reviewer	The verdict	Edits or commits to the deliverable	ACCEPT with evidence, or numbered REJECT

All three run headless OpenCode, harness and model named at the top of each mandate.

Passing the shipped checks is not enough to get an ACCEPT.

Independent Reviewer's mandate forbids touching the deliverable, so its verdict stays separate from the work.

Beyond the checks For every requirement it tries invalid input, retries, concurrency, boundaries and restarts.

Reproducible Each failure names the requirement, expected vs actual, and the command that reproduces it.

Answered Builder must answer every failure by number in a new commit, back through review.

A BAD RESULT IT CAUGHT

Review found 6 defects: impossible dates (2026-02-30) and invalid time zones not returning 422, reset accepting invalid references, wrong error codes. Fixed in 33c49f8.

Stale verification caught: Reviewer accepted 9f0dad3 while main was at 33c49f8. Planner refused to close; Reviewer re-ran 120/120 on 33c49f8, then ACCEPT.

Before the real run, the factory proved its loop end to end.

16

numbered requirements
written by Planner

8 / 8

official checks passed
claimed stage: 1

20 / 20

concurrent increments,
none lost

~35 min

dispatch to final
report, no human input

Reviewer went past the shipped suite: boundary values, 12 invalid inputs rejected, a second port, an empty-body 204, keep-alive. The implementation commit is credited to Builder, the ledger to Planner.

How far the factory got on the real track.

1

stage reached,
claimed on official check

120/120

official tests
passed

170

numbered requirements
verified

2 h 50

dispatch to ACCEPT,
no human input

Two fix rounds after review (9f0dad3, 33c49f8) before the final ACCEPT. Stages 2–4 not attempted: the model credit ran out after stage 1.

Gate check on the submitted image: built and started with 2 CPUs / 2 GB, answered /health with {"status": "ok"}.

A whole factory on open-weights models and one Windows laptop.

BAND rooms, @mention routing, room log

OpenCode headless coding agent per seat

GLM-5.2 on Featherless one open model, OpenAI-compatible API

BAND SDK OpencodeAdapter connects each seat

Auto-restart each seat server restarts itself if it crashes

Per-seat git identity commits credited to the seat that made them

MEASURED

\$13.83

model spend, stage 1

488

billed requests

2 h 50

run time

All from the \$25 hackathon credit. Practice run: under \$1.60.

Point it at a different problem by changing one message.

IN THE MANDATES

- Who owns what
- How work is handed off
- What evidence a handoff carries
- When to reject
- What "done" means

IN THE TASK MESSAGE ONLY

- The specification path
- The result repository
- The official check command
- The scratch folder for probes

The mandates name no endpoints, fields or error codes. FACTORY.md stands the factory up from scratch.

Honest limits, and what we would change next.

Context is per seat

A seat only sees what @mentions it, so handoffs must carry the full requirement text.

Verdicts must be messages

An early review was written in a workspace but not posted; the mandate now requires the verdict in the room.

Clean up after checks

A leftover container could block the next run; seats now remove what they start.

Rules need enforcement

Planner's git identity is on 3 of 4 commits despite its mandate. Single-writer rules must be enforced by tool permissions, not words alone.

THANK YOU

Team Invictus Earth2

Three keys. One verdict.
No human in the loop.

github.com/DataGuy-Eterniti/invictus-earth2-keepers

Repository includes FACTORY.md, mandates/, room.json and one folder per stage.
